

Abstract of the Disclosure:

In a connector member, each of contacts has a contact portion to be connected to a counterpart connector, a retention portion retained by an insulator, and a connecting portion to be connected with a cable. Each connecting portion is connected with the cable by soldering and projected from the insulator in an axial direction of the contact. Each connecting portion is formed obliquely in a contact pitch direction of the connector. A plug connector is provided with a shell on an upper surface of the connector member, and covered with a hood so as to expose a fitting portion.
